## Introduction

Payment gateways facilitate electronic commerce by enabling merchants to accept credit cards and electronic checks as methods of payment for goods and services sold online. The gateway acts as a bridge between the merchant's Website and the financial institutions that process payment transactions. Payment data is collected online from the shopper and submitted to the gateway for real-time authorization.

Authorization is the process of checking the validity and available balance of a customer's credit card before the transaction can be accepted. To authorize a given credit card transaction, the gateway transmits the transaction information to the appropriate financial institutions for validation, then returns the response (approved or declined) from the institution to the merchant or customer. The payment gateway supports real-time and offline requests for credit card authorization.

Note: The payment gateway is targeted towards merchants that process Card-Not-Present transactions. In a Card-Not-Present transaction, the merchant and the shopper are not in the same physical location and the customer usually calls in the payment data or keys in the details of the credit card on a Website. All e-commerce and mail/telephone orders are Card-Not-Present transactions.

The gateway also supports electronic check transactions. Merchants can collect consumer bank account numbers and routing numbers to pay for purchases.

This document describes how transactions can be submitted to the gateway for real-time processing using the **Simple Integration Method**.

## Simple Integration Method (SIM)

### What is SIM?

The Simple Integration Method is a relatively simple and secure method to submit transactions to the Payment Gateway. Merchants using this method have the option to let the gateway handle all the steps in transaction processing—payment data collection, data submission, and response to customer. Any request to the gateway is required to contain information that indicates to the gateway that the transaction is authentic and has been submitted for processing with the merchant's knowledge. This information is contained in a fingerprint that has to be generated by the merchant and included with every request submitted to the gateway. The fingerprint is a hash generated using the HMAC hashing algorithm on a set of pre-defined transaction-specific fields. If the fingerprint cannot be validated by the gateway, the request will be rejected.

### How does SIM work?

The merchant collects payment information on their Website using either their own payment form or by requesting the gateway's Payment Form. The merchant can also request the gateway's Receipt Page to return to the customer. For each request or transaction submitted to the Payment Gateway, the merchant generates and submits a unique fingerprint.

### *Collecting Payment Data*

The merchant can choose to host the Web page where the customer enters payment data, or request that the gateway host the page. The page hosted by the gateway to collect payment data is referred to as the Payment Form, and can be configured by the merchant to look like their Website. Using the gateway-hosted Payment Form, merchants can collect payment data securely without having a secure Website.

### *Submitting a Request to the Gateway*

A request to generate the gateway's Payment Form must include a unique merchant-generated fingerprint. This fingerprint is used to authenticate that the request originated from an authorized merchant.

If the merchant hosts their own secure payment form, the fingerprint must be submitted along with transaction information to the gateway.

### *Rendering a Response to the Customer*

The response returned by the gateway to the customer's browser is referred to as a Receipt Page. The merchant can configure the Receipt Page to look like their Website. However, the merchant also has the option to receive the transaction response from the gateway, customize it, and send back a receipt page to the gateway. The gateway then relays the merchant-generated receipt page to the customer's browser. This response option is referred to as Relay Response. Merchants who use Relay Response can exercise a greater degree of control over the messaging of a response to the customer.

## SIM Implementation

In order to integrate to the Payment Gateway using the Simple Integration Method, the merchant needs to be able to construct an HTML form that can generate a fingerprint and post information including the fingerprint to **<https://secure.authorize.net/gateway/transact.dll>**.

### ***What is required to implement SIM?***

- The merchant's hosting provider must have server scripting or CGI capability like ASP, PHP, Perl, JSP
- Merchants should be able to securely store files containing sensitive account information and apply access controls. They also have to be able to store sensitive information in a secure, restricted-access database.
- Merchant's hosting their own payment form need to have secure servers.

### **Steps to Integrate to the gateway using SIM**

1. The merchant obtains a transaction key from the Merchant Interface. (The gateway-generated transaction key is similar to a password and is used to generate a fingerprint. The Merchant Interface is a tool through which merchants can manage their accounts and transaction activity. A Login ID and password are required to access this tool. The URL to the Merchant Interface is available to the merchant from their merchant service provider)
2. The merchant needs to modify their Web pages to contain the fingerprint-generating function, or script. The script, whether on a server or embedded in the HTML page itself, generates the unique fingerprint.
3. The merchant can create the fingerprint by modifying sample scripts provided in the Merchant Interface, or by writing and implementing their own script.
4. The fingerprint and the information required to process the transaction are posted to the gateway. The Standard Transaction Submission API for SIM describes the information that is required to submit a transaction to the gateway.

### ***Obtaining and Storing the Transaction Key***

The transaction key is a gateway-generated, random alphanumeric string that is one of the inputs to the fingerprint-generating function. The transaction key is a unique value that is exchanged between the gateway and the merchant. It is used by the gateway to authenticate the fingerprint and the transaction as originating from an authorized merchant. It is therefore extremely important that the transaction key is stored securely on the merchant's server once it has been obtained from the Merchant Interface.

To obtain the Transaction Key from the Merchant Interface:

1. Log into the Merchant Interface
2. Select *Settings* from the Main Menu
3. Click on the Obtain Transaction Key in the Security section
4. Type in the answer to your secret question (The secret question and answer is setup during account activation. It is required to authenticate the merchant before the transaction key is generated.)
5. Click Submit

6. The transaction key is returned by the Merchant Interface

### ***Creating and generating a fingerprint***

The fingerprint is a hash generated using an HMAC algorithm on the following fields.

- Merchant Login. This is the merchant Login ID sent in the *x\_Login* field in the Standard Transaction Submission API for SIM
- Transaction Key
- Timestamp of generation of the fingerprint. This must match the time sent in in *x\_FP\_Timestamp* field in the Standard Transaction Submission API for SIM.
- Sequence number of the transaction. This can be a merchant-specific invoice number or a randomly-generated number. This number needs to be sent in the *x\_FP\_Sequence* field in the Standard Transaction Submission API for SIM.
- Amount of the transaction. The final transaction amount used to generate the fingerprint has to correspond with the amount sent in the *x\_Amount* field in the Standard Transaction Submission API for SIM.

Sample fingerprint-generating functions, or scripts, are provided in the Merchant Interface. Please refer to Appendix E for details on the sample scripts and integrations.

### ***Construct an HTML form to generate the fingerprint and POST transactions to the gateway***

The post string will consist of a set of NAME/ VALUE pairs. The NAME is the field name and indicates to the gateway what information is being submitted. The VALUE contains the content of the field. The response rendered by the gateway depends on the information in the post string. (Please refer to the Sample SIM Integration – Form Construction section of this document)

#### **Merchant collects payment data**

If the merchant hosts their own payment form then the information posted to the gateway needs to contain the minimum set of fields required to process the transaction. The set of required fields is described in the section Standard Transaction Submission API for SIM.

#### **Merchant Requests the Gateway's Payment Form**

If the merchant does not have the ability to host secure Web pages then the post string needs to contain only the information required to identify the merchant and request the gateway's Payment Form. If the merchant has collected information from a customer on their site before requesting the gateway's Payment Form, the merchant can include that information in the post string as hidden fields. This results in the gateway rendering a Payment Form populated with the information passed in by the merchant.

#### **Configuring the Gateway Response (Receipt Page or Relay Response)**

The post string can contain information that indicates to the gateway how the Receipt Page rendered by the gateway should be formatted. Merchants requesting Relay Response can also provide a URL in the post string to which the gateway will post a response. The merchant's site can receive, parse, and customize the response and post it back to the gateway. The gateway will then relay the response to the customer.

## Using the Merchant Interface to Configure SIM

The merchant has the option to submit information in the post string regarding the format of the Receipt Page, the Payment Form, and the destination URL of the Relay Response for each transaction. Alternatively, the merchant can configure these in the Merchant Interface. (The Merchant Interface is a tool through which merchants can manage their accounts and their transaction activity. A Login ID and password are required to access this tool. The URL to the Merchant Interface is available to the merchant from their merchant service provider.) It is recommended implementation is to not send in configuration data on a per-transaction basis.

### Payment Form Settings

- The merchant can configure the following on the Payment Form:
  - The background color of the form
  - The color of the text on the form
  - The header text
  - The footer text
- The merchant can also configure the set of fields on the Payment Form that should be displayed to the customer, as well as the set of fields the customer will be required to fill out

To configure Payment Form fields, header and footer text and color:

1. Log into the Merchant Interface
2. Select *Settings* from the Main Menu
3. Click on the *Payment Forms* link in the Transaction Submission section

Note: When creating headers and footers for receipt pages avoid using double quotes.

### Receipt Page Settings

- The merchant can configure the following on the Receipt Page:
  - The background color of the form
  - The color of the text on the form
  - The header text
  - The footer text
- The merchant can also define the method by which the customer should be returned to the merchant Website and the destination URL to which the customer will be returned.

To configure the Receipt Page:

1. Log into the Merchant Interface
2. Select *Settings* from the Main Menu
3. Click on the *Receipt Page* link in the Transaction Response section

Note: When creating headers and footers for receipt pages avoid using double quotes.

## Relay Response URL Settings

The merchant can configure the default URL to which the gateway should send the response in the Merchant Interface by doing the following:

1. Log into the Merchant Interface
2. Select *Settings* from the Main Menu
3. Click on *Relay Response* in the Transaction Response section
4. Enter the URL to which the gateway should send the response by default

The merchant can configure one or more valid Relay Response URLs. To configure valid relay response URLs in addition to the default specified

1. Log into the Merchant Interface
2. Select *Settings* from the Main Menu
3. Click on the *Response /Receipt URL* link in the Transaction Response section
4. Click on the *Add URL* link
5. Add a valid URL
6. Click Submit

The gateway will reject the transaction if the URL sent in the transaction is not configured through the Merchant Interface.

## Sample SIM Integrations – Form Construction

This section describes how to create an HTML form to post transactions to the gateway with a fingerprint. The basic HTML tags used to construct a form to post a transaction to the gateway would be written as follows:

```
<FORM METHOD=POST  
ACTION="https://secure.authorize.net/gateway/transact.dll">  
</FORM>
```

Any form fields that need to be sent to the system would be enclosed as `<INPUT>` fields within the opening `<FORM>` tag and the closing `</FORM>` tag. For example, a form that contained a merchant's Login ID would look like this:

```
<INPUT TYPE=HIDDEN NAME="x_Login" VALUE="your login ID goes here">
```

Some things to note about the sample line above:

- `<INPUT>` is an HTML tag that does not need a closing tag (unlike `<FORM>` which needs a closing tag `</FORM>`).
- `TYPE` in the sample above is an attribute of the `INPUT` tag and has a value `HIDDEN`. In this case it means the information being passed to the gateway server would be hidden from the customer's HTML page (since the information that is being passed is the merchant's Login ID).
- The `NAME="x_Login"` is the category, or field, of information that is being passed, in this case the Login ID of the merchant.
- The `VALUE="your Login ID goes here"` is where the merchant would put their merchant Login ID (inside the double quotes).
- The `NAME/VALUE` pair is one of the things that the gateway server looks for when a transaction is submitted. If part of the `NAME/VALUE` pair is not present or improperly formed, the transaction will be rejected.

The gateway will accept fields that are not specified in the API so long as the name used to describe the field is not identical to a field name in the API. These fields are called “user” fields and can contain any information that might be useful in the transaction. User fields will be echoed back with the results of the transaction and will be displayed on the merchant's receipts; they will not be displayed on the customer's receipts

The following are some examples of HTML code, along with the server-side script, that can be customized and inserted into a merchant's Website to provide easy ways to integrate the Website with the system. Server-side scripting capability on the merchant Website is required for this integration, as the script needs access to a secret transaction key that is stored securely in the merchant's Web server. Sample code and library in ASP, PHP, and Perl are provided in the Merchant Interface. As part of the integration, the merchant Website must provide the appropriate parameters to the `InsertFP` or `CalculateFP` library functions that are provided with the sample code.

## Example 1 – Minimum requirements for requesting a Payment Form

The following HTML code along with the server-side script represents the minimum data that would need to be inserted into a page to provide a connection to the system. It shows that the fingerprint, time stamp, and the sequence number are inserted into the HTML form POST along with Login ID and other required fields. The result of this HTML code snippet is a button. Clicking on the button will take the user to the gateway's Payment Form.

A call to generate the fingerprint should be made when the button is clicked and before the Payment Form request is made to the gateway. A sequence number should be generated and the total amount of the transaction calculated before the call to generate the fingerprint is made. The function used to generate the fingerprint takes these fields (amount, transaction key, Login ID, and sequence number) The transaction amount should not change after the fingerprint is generated. All trailing spaces need to be removed from the fields used to generate the fingerprint

```
<!--#INCLUDE FILE="simlib.asp"-->
<FORM METHOD=POST ACTION="https://secure.authorize.net/gateway/transact.dll">
    <% ret = InsertFP (loginid, txnkey, amount, sequence) %>
<INPUT TYPE=HIDDEN NAME="x_Login" VALUE="your login ID goes here">
<INPUT TYPE=HIDDEN NAME="x_Show_Form" VALUE="PAYMENT_FORM">
<INPUT TYPE=HIDDEN NAME="x_Amount" VALUE="amount goes here">
<INPUT TYPE=SUBMIT VALUE="Click here for secure payment form">
</FORM>
```

The function InsertFP is provided by the gateway and can be downloaded from the Merchant Interface. This function must be called within a server-side script on the merchant Web server. The above example shows the call being made in an ASP scripting environment.

## Example 2 – Using a form to gather information

The following HTML code along with the server-side script demonstrates the ability to send additional information to the system, including information that is specified by the customer. The result of this HTML code snippet is a page that displays a form allowing the customer to specify their name and any specific shipping instructions. The *x\_First\_Name* and *x\_Last\_Name* fields are normal fields recognized by the system. The *Shipping\_Instructions* field is not a field recognized by the system, and so it is treated as a user field. System-recognized fields can also be used for normal shipping information. The code also shows that the fingerprint, time stamp, and the sequence number are inserted into the HTML form POST along with Login ID and other required fields.

```
<!--#INCLUDE FILE="simlib.asp"-->
<FORM METHOD=POST ACTION="https://secure.authorize.net/gateway/transact.dll">
    <% ret = InsertFP (loginid, txnkey, amount, sequence) %>
<INPUT TYPE=HIDDEN NAME="x_Login" VALUE="your login ID goes here">
<INPUT TYPE=HIDDEN NAME="x_Show_Form" VALUE="PAYMENT_FORM">
<INPUT TYPE=HIDDEN NAME="x_Amount" VALUE="amount goes here">
<INPUT TYPE=HIDDEN NAME="x_Cust_ID" VALUE="a unique customer ID goes here">
<INPUT TYPE=HIDDEN NAME="x_Description" VALUE="description of transaction">
<INPUT TYPE=HIDDEN NAME="x_Invoice_Num" VALUE="invoice number goes here">
Enter your first name:
<INPUT TYPE=TEXT NAME="x_First_Name"><BR>
Enter your last name:
```

```
<INPUT TYPE=TEXT NAME="x_Last_Name"><BR>
Enter Any special shipping instructions:
<INPUT TYPE=TEXT NAME="Shipping_Instructions"><BR>
<INPUT TYPE=SUBMIT VALUE="Click here for secure payment form">
</FORM>
```

The function InsertFP is provided by the gateway and can be downloaded from the Merchant Interface.

### Example 3 – Requesting a Receipt Page

The following HTML code shows the request for the Receipt Page, including generating the fingerprint and sending it along with rest of the fields.

```
<!--#INCLUDE FILE="simlib.asp"--><FORM METHOD=POST
ACTION="https://secure.authorize.net/gateway/transact.dll">
    <% ret = InsertFP (loginid, txnkey, amount, sequence) %>
<INPUT TYPE=HIDDEN NAME="x_Version" VALUE="3.1">
<INPUT TYPE=HIDDEN NAME="x_Login" VALUE="your login ID goes here">
<INPUT TYPE=HIDDEN NAME="x_Card_Num" VALUE="customer's credit card number">
<INPUT TYPE=HIDDEN NAME="x_Exp_Date" VALUE="customer's credit card expiration
date goes here">
<INPUT TYPE=HIDDEN NAME="x_Amount" VALUE="amount goes here">
<INPUT TYPE=SUBMIT VALUE="Submit">
</FORM>
```

The function InsertFP is provided by the gateway and can be downloaded from the Merchant Interface.

### Example 4 – Requesting a Payment Form and a Relay Response

The following are the minimum requirements for requesting a Relay Response from the gateway. This code includes the function for generating the fingerprint and sending it along with rest of the fields.

```
<!--#INCLUDE FILE="simlib.asp"--><FORM METHOD=POST
ACTION="https://secure.authorize.net/gatewaytransact.dll/">
    <% ret = InsertFP (loginid, txnkey, amount, sequence) %>
<INPUT TYPE=HIDDEN NAME="x_Login" VALUE="your login ID goes here">
<INPUT TYPE=HIDDEN NAME="x_Amount" VALUE="amount goes here">
<INPUT TYPE=HIDDEN NAME="x_Relay_Response" VALUE="True">
<INPUT TYPE=HIDDEN NAME="x_Relay_URL" VALUE="Any valid URL">
<INPUT TYPE=SUBMIT VALUE="Click here for secure payment form">
</FORM>
```

The function InsertFP is provided by the gateway and can be downloaded from the Merchant Interface.

- Since the HTML code that is returned to the browser appears to come from the gateway server, any links to images need to be absolute URLs with the full path to the server on which the images reside. If relative URLs are used, the customer's browser will try to load the images from the gateway server and would fail.

- The URL specified in x\_Relay\_URL should be a script that can interactively parse the information that is posted to it. The URL can be a plain HTML page if a static response is desired for every transaction. In this scenario, the merchant's Web server will need to be configured to allow the POST method to plain HTML pages.
- Use of frames is not recommended. Even though the Payment Form used will be secure the lock icon on the user's taskbar will key off the surrounding frame and not off the Payment Form. The page will not look secure to the customer.
- Redirects in the relay scripts are not recommended, as the information may not be transferred properly.
- When the merchant's response is relayed back to the customer, anything that is in the HTTP headers will be replaced. This means if a developer is relying on custom information to be in these headers, such as cookies, their implementation will most likely fail.

## Standard Transaction Submission API for SIM

The Standard Transaction Submission API defines the information that can be submitted to the gateway for real-time transaction processing. The API consists of a set of fields that are required for each transaction, and a set of fields that are optional. Under the API, the gateway accepts a NAME/ VALUE pair. The NAME is the field name and indicates to the gateway what information is being submitted. The VALUE contains the content of the field. In transmitting information to the gateway the merchant site should post transactions to **<https://secure.authorize.net/gateway/transact.dll>**.

The following tables contain the data fields that may be submitted to the system with any transaction. The fields are grouped logically in the tables, based on the information submitted. Each table contains the following information:

- *Field* – Name of the parameter that may be submitted on a transaction
- *Required* – Indicates whether the field is required on a transaction. If *Conditional*, indicates that the field is required based on the existence or value of another field. In cases where a dependency exists, an explanation is provided.
- *Value* – Lists the possible values that may be submitted for the field. In cases where a format is validated, an explanation is provided.
- *Max Length* – Indicates the maximum number of characters that may be supplied for each field.
- *Description* – Provides additional details on how the field is used

### Merchant Account Information

The following fields in the API allow the system to identify the merchant submitting the transaction and the state of the merchant's account on the gateway.

FIELD	REQUIRED	VALUE	MAX LENGTH	DESCRIPTION
x_Login	Required	Varies by merchant	20	Pass the Login ID used to access the Merchant Interface.
x_Version	Optional  If no value is specified, the value located in the Response String Version settings within the Merchant Interface will be used.	3.1	3	Indicates to the system the set of fields that will be included in the response: <ul style="list-style-type: none"> <li>• 3.0 is the standard version</li> <li>• 3.1 allows the merchant to utilize the Card Code feature</li> </ul>
x_Test_Request	Optional	TRUE, FALSE	5	Indicates whether the transaction should be processed as a test transaction. Please refer to Appendix D for further information on this field.

## Fingerprint Fields

FIELD	REQUIRED	VALUE	MAX LENGTH	DESCRIPTION
x_FP_Hash	Required			This is the fingerprint generated using the HMAC hashing algorithm on the merchant's transaction key and the following fields: <ul style="list-style-type: none"> <li>• merchant Login ID (x_Login)</li> <li>• amount of the transaction (x_Amount)</li> <li>• the sequence number of the transaction (x_FP_Sequence)</li> <li>• the time when the sequence number was generated (x_FP_Timestamp)</li> <li>• and optionally the currency code (x_Currency_Code)</li> </ul>
x_FP_Sequence	Required			This is a merchant-determined value that ensures the fingerprint is unique.
x_FP_Timestamp	Required	UTC time in seconds since Jan 1, 1970.		This is the time of fingerprint generation. Merchant sends in this value to indicate when the fingerprint was generated.

## Payment Form Fields

These fields are optional and need to be used only if the merchant is using the gateway's Payment Form to collect payment data. All these fields except *x\_Show\_Form* can also be configured in the Merchant Interface and do not have to be submitted with each transaction.

FIELD	REQUIRED	VALUE	MAX LENGTH	DESCRIPTION
x_Show_Form	Conditional  Required if the merchant is using the gateway's Payment Form	PAYMENT FORM		This field should be passed in with the value of PAYMENT FORM only if the merchant wishes to use the gateway's Payment Form to collect payment data
x_Header_HTML_Payment_Form	Optional	Valid Text or HTML		The text submitted in this field will be displayed as the header on the Payment Form.
x_Footer_HTML_Payment_Form	Optional	Valid Text or HTML		The text submitted in this field will be displayed as the footer on the Payment Form.

## Receipt Page Fields

All fields in this section are optional. The merchant can configure the information captured in these fields in the Merchant Interface instead of sending it in with every transaction.

FIELD	REQUIRED	VALUE	MAX LENGTH	DESCRIPTION
x_Header_HTML_Receipt	Optional	Valid Text or HTML code.		The text contained in this field will be displayed at the top of the Receipt Page.
x_Footer_HTML_Receipt	Optional	Valid Text or HTML code		The text contained in this field will be displayed at the bottom of the Receipt Page.
x_Receipt_Link_Method	Optional	LINK POST GET		This field specifies the type of link that is made back to a merchant's Website.
x_Receipt_Link_Text	Optional	Any Valid text		<p>If the x_Receipt_Link_Method is LINK, the value in this field will become a hyperlinked text on the receipt page</p> <p>If the x_receipt_link_method is GET or POST the value in this field becomes the text of a submit button. An HTML form is created in the Receipt Page that has hidden fields containing the results of the transaction processed.</p>
x_Receipt_Link_URL	Optional	Any Valid URL		<p>If the x_Receipt_Link_Method is LINK, the URL specified in the fields becomes the target of the hyperlinked text.</p> <p>If the x_Receipt_Link_Method is GET or POST, the URL will become the action of the HTML form.</p> <p>To be accepted as valid by the gateway, the URL must be configured in the Merchant Interface.</p>

## Fields Common to Both the Payment Form and Receipt Page

All fields in this section are optional. The merchant can configure the information captured in these fields in the Merchant Interface instead of sending it in on every transaction.

FIELD	REQUIRED	VALUE	MAX LENGTH	DESCRIPTION
x_Logo_URL	Optional	Any valid URL		This field is ideal for displaying a merchant logo on a page. The target

FIELD	REQUIRED	VALUE	MAX LENGTH	DESCRIPTION
				of this URL will be displayed on the header of the Payment Form and Receipt Page.
x_Background_URL	Optional	A valid URL		This field will allow the merchant to customize the background image of the Payment Form and Receipt Page. The target of the specified URL will be displayed as the background.
x_Color_Background	Optional	Any valid HTML color name or color hex code		Value in this field will set the background color for the Payment Form and Receipt Page.
x_Color_Link	Optional	Any valid HTML color name or color hex code		This field allows the color of the HTML links for the Payment Form and Receipt Page to be set to the value submitted in this field.
x_Color_Text	Optional	Any valid HTML color name or color hex code		This field allows the color of the text on the Payment Form and the Receipt Page to be set to the value submitted in this field.

## Relay Response Fields

The following fields indicate to the gateway that the merchant is requesting a Relay Response. They should not be passed in if the merchant is requesting a Receipt Page or a Payment Form

FIELD	REQUIRED	VALUE	MAX LENGTH	DESCRIPTION
X_Relay_Response	Conditional – if the merchant requires a Relay Response	TRUE		This is required to be set to TRUE. This indicates to the gateway that the response will be relayed to the customer's browser
X_Relay_URL	Optional	Any valid URL		Contains the URL to which the gateway will post the response. The gateway will validate the URL submitted in this field with the values configured through the Merchant Interface. The gateway will reject the transaction if the value submitted does not match any of the URLs configured through the Merchant Interface.  If no value is passed in this field, the gateway will post the response to the default relay URL configured in the Merchant Interface.

## Customer Name and Billing Address

The customer billing address fields listed below contain customer billing address information associated with each transaction.

FIELD	REQUIRED	VALUE	MAX LENGTH	DESCRIPTION
x_First_Name	Optional	Any string	50	Contains the first name of the customer associated with the billing address for the transaction.
x_Last_Name	Optional	Any string	50	Contains the last name of the customer associated with the billing address for the transaction.
x_Company	Optional	Any string	50	Contains the company name associated with the billing address for the transaction.
x_Address	Optional	Any string	60	Contains the address of the customer associated with the billing address for the transaction.
x_City	Optional	Any string	40	Contains the city of the customer associated with the billing address for the transaction.
x_State	Optional If passed, the value will be verified.	Any valid two-digit state code or full state name	40	Contains the state of the customer associated with the billing address for the transaction.
x_Zip	Optional	Any string	20	Contains the zip of the customer associated with the billing address for the transaction.
x_Country	Optional If passed, the value will be verified.	Any valid two-digit country code or full country name (spelled in English)	60	Contains the country of the customer associated with the billing address for the transaction.
x_Phone	Optional	Any string  Recommended format is (123)123-1234	25	Contains the phone number of the customer associated with the billing address for the transaction.
x_Fax	Optional	Any string  Recommended format is (123)123-1234	25	Contains the fax number of the customer associated with the billing address for the transaction.

## Additional Customer Data

Merchants may provide additional customer information with a transaction, based on their respective requirements.

FIELD	REQUIRED	VALUE	MAX LENGTH	DESCRIPTION
-------	----------	-------	------------	-------------

FIELD	REQUIRED	VALUE	MAX LENGTH	DESCRIPTION
x_Cust_ID	Optional	Any string	20	Unique identifier to represent the customer associated with the transaction.
x_Customer_IP	Optional	Required format is 255.255.255.255. If this value is not passed, it will default to 255.255.255.255	15	IP address of the customer initiating the transaction.
x_Customer_Tax_ID	Optional	9 digits/numbers only	9	Tax ID or SSN of the customer initiating the transaction.

## Email Settings

The following fields describe how and when emails will be sent when transactions are processed by the system.

FIELD	REQUIRED	VALUE	MAX LENGTH	DESCRIPTION
x_Email	Optional	Any valid email address	255	Email address to which the customer's copy of the confirmation email is sent.  No email will be sent to the customer if the email address does not meet standard email format checks.
x_Email_Customer	Optional	TRUE, FALSE  If no value is submitted, system will default to the value configured in the Merchant Interface.	5	Indicates whether a confirmation email should be sent to the customer.
x_Merchant_Email	Optional	Any valid email address	255	Email address to which the merchant's copy of the customer confirmation email should be sent. If a value is submitted, an email will be sent to this address as well as the address(es) configured in the Merchant Interface.

## Invoice Information

Based on their respective requirements, merchants may submit invoice information with a transaction. Two invoice fields are provided in the gateway API.

FIELD	REQUIRED	VALUE	MAX LENGTH	DESCRIPTION
-------	----------	-------	------------	-------------

FIELD	REQUIRED	VALUE	MAX LENGTH	DESCRIPTION
x_Invoice_Num	Optional	Any string	20	Merchant-assigned invoice number.
x_Description	Optional	Any string	255	Description of the transaction.

## Customer Shipping Address

The following fields describe the customer shipping information that may be submitted with each transaction.

FIELD	REQUIRED	VALUE	MAX LENGTH	DESCRIPTION
x_Ship_To_First_Name	Optional	Any string	50	Contains the customer shipping first name.
x_Ship_To_Last_Name	Optional	Any string	50	Contains the customer shipping last name.
x_Ship_To_Company	Optional	Any string	50	Contains the customer shipping company.
x_Ship_To_Address	Optional	Any string	60	Contains the customer shipping address.
x_Ship_To_City	Optional	Any string	40	Contains the customer shipping city.
x_Ship_To_State	Optional  If passed, the value will be verified.	Any valid two-digit state code or full state name	40	Contains the customer shipping state.
x_Ship_To_Zip	Optional	Any string	20	Contains the customer shipping zip.
x_Ship_To_Country	Optional  If passed, the value will be verified.	Any valid two-digit country code or full country name (spelled in English)	60	Contains the customer shipping country.

## Transaction Data

The following fields contain transaction-specific information such as amount, payment method, and transaction type.

FIELD	REQUIRED	VALUE	MAX LENGTH	DESCRIPTION
x_Amount	Required	Any amount	15	Total value to be charged or credited inclusive of tax.
x_Currency_Code	Optional	Valid currency code	3	Currency of the transaction amount. If left blank, this value will default to the value specified in the Merchant Interface. See Appendix G for other

FIELD	REQUIRED	VALUE	MAX LENGTH	DESCRIPTION
				values.
x_Method	Required	CC, ECHECK	N/A	Indicates the method of payment for the transaction being sent to the system. If left blank, this value will default to CC.
x_Type	Required	AUTH_CAPTURE, AUTH_ONLY, CAPTURE_ONLY, CREDIT, VOID, PRIOR_AUTH_CAPTURE	N/A	Indicates the type of transaction. If the value in the field does not match any of the values stated, the transaction will be rejected.  If no value is submitted in this field, the gateway will process the transaction as an AUTH_CAPTURE.
x_Bank_ABA_Code	Conditional  Required if x_Method = ECHECK	Valid routing number	9	Routing number of a bank for eCheck.Net transactions.
x_Bank_Acct_Num	Conditional  Required if x_Method = ECHECK	Valid account number	20	Checking or savings account number.
x_Bank_Acct_Type	Conditional  Required if x_Method = ECHECK	CHECKING, SAVINGS	8	Describes the type of bank account; if no value is provided, default is set to CHECKING.
x_Bank_Name	Conditional  Required if x_Method = ECHECK	Valid bank name	50	Contains the name of the customer's financial institution.
x_Bank_Account_Name	Conditional  Required if x_Method = ECHECK	Name on the Customer's bank account		Is the customer's name as it appears on their bank account
x_Echeck_Type	Conditional  Required if x_Method = ECHECK	WEB		This indicates that the e-check payment request originated from a Website. The system will default this value to WEB if no value is sent.
x_Card_Num	Conditional	Numeric credit card number	22	Contains the credit card number.

FIELD	REQUIRED	VALUE	MAX LENGTH	DESCRIPTION
	Required if x_Method = CC			
x_Exp_Date	Conditional  Required if x_Method = CC	MMYY, MM/YY, MM-YY, MMYYYY, MM/YYYY, MM-YYYY, YYYY-MM-DD, YYYY/MM/DD	N/A	Contains the date on which the credit card expires.
x_Card_Code	Optional	Valid CVV2, CVC2 or CID value	4	Three- or four- digit number on the back of a credit card.
x_Trans_ID	Conditional  Required if x_Type = CREDIT, VOID, or PRIOR_AUTH_CAPTURE	Valid transaction ID	10	ID of a transaction previously authorized by the gateway.
x_Auth_Code	Conditional  Required if x_Type = CAPTURE_ONLY	Valid authorization code	6	Authorization code for a previous transaction not authorized on the gateway that is being submitted for capture.

## Level 2 Data

The system supports Level 2 transaction data by providing the following fields as part of the transaction submission API.

FIELD	REQUIRED	VALUE	MAX LENGTH	DESCRIPTION
x_PO_Num	Optional	Any string	25	Contains the purchase order number.
x_Tax	Optional	Any valid amount	15	Contains the tax amount.
x_Tax_Exempt	Optional	TRUE, FALSE	5	Indicates whether the transaction is tax exempt.
x_Freight	Optional	Any valid amount	10	Contains the freight amount charged.
x_Duty	Optional	Any valid amount	10	Contains the amount charged for duty.

## Transaction Submission API for Wells Fargo SecureSource Merchants

For merchants who process transactions through the Wells Fargo SecureSource product, some additional rules apply to transaction processing. Fields that are optional in the Standard Transaction Submission API are required for Wells Fargo SecureSource merchants. The following tables describe these required fields. Only those fields that are different from the standard API are called out in this section.

### Customer Name and Billing Address

FIELD	REQUIRED	VALUE	MAX LENGTH	DESCRIPTION
x_First_Name	Required	Any string	50	Contains the first name of the customer associated with the billing address for the transaction.
x_Last_Name	Required	Any string	50	Contains the last name of the customer associated with the billing address for the transaction.
x_Company	Required	Any string	50	Contains the company name associated with the billing address for the transaction.
x_Address	Required	Any string	60	Contains the address of the customer associated with the billing address for the transaction.
x_City	Required	Any string	40	Contains the city of the customer associated with the billing address for the transaction.
x_State	Required	Any valid two-digit state code or full state name	40	Contains the state of the customer associated with the billing address for the transaction.
x_Zip	Required	Any string	20	Contains the zip of the customer associated with the billing address for the transaction.
x_Country	Required	Any valid two-digit country code or full country name (spelled in English)	60	Contains the country of the customer associated with the billing address for the transaction.
x_Phone	Required	Any string	25	Contains the phone number of the customer

FIELD	REQUIRED	VALUE	MAX LENGTH	DESCRIPTION
		Recommended format is (123)123-1234		associated with the billing address for the transaction.

## Email Settings

FIELD	REQUIRED	VALUE	MAX LENGTH	DESCRIPTION
x_Email	Required	Any valid email address	255	Email address to which a confirmation email is sent.

## Additional Customer Data

FIELD	REQUIRED	VALUE	MAX LENGTH	DESCRIPTION
x_Customer_IP	Required	Required format is 255.255.255.255. If this value is not passed, it will default to 255.255.255.255.	15	IP address of the customer initiating the transaction.
x_Customer_Organization_Type	Required	I, B  I = Individual B = Business	N/A	Required for all eCheck transactions for Wells Fargo SecureSource Merchants.
x_Customer_Tax_ID	Conditional  IF x_Type = ECHECK, merchant must provide EITHER x_Customer_Tax_ID OR x_Drivers_License_Num AND x_Drivers_License_State AND x_Drivers_License_DOB	9 digits or numbers only	9	Tax ID or SSN of the customer initiating the transaction. If the Tax ID or SSN is not available, the customer's driver's license number, driver's license state and date of birth must be used in its place.
x_Drivers_License_Num	Conditional  IF x_Type = ECHECK, merchant must provide EITHER x_Customer_Tax_ID OR x_Drivers_License_Num AND x_Drivers_License_State AND		50	Required for all eCheck transactions for Wells Fargo SecureSource Merchants where the Tax ID or SSN is not provided.

FIELD	REQUIRED	VALUE	MAX LENGTH	DESCRIPTION
	x_Drivers_License_DOB			
x_Drivers_License_State	Conditional  IF x_Type = ECHECK, merchant must provide EITHER x_Customer_Tax_ID OR x_Drivers_License_Num AND x_Drivers_License_State AND x_Drivers_License_DOB	2-character state abbreviation	2	Required for all eCheck transactions for Wells Fargo SecureSource Merchants where the Tax ID or SSN is not provided.
x_Drivers_License_DOB	Conditional  IF x_Type = ECHECK, merchant must provide EITHER x_Customer_Tax_ID OR x_Drivers_License_Num AND x_Drivers_License_State AND x_Drivers_License_DOB	YYYY-MM-DDD, YYYY/MM/DD, MM/DD/YYYY, MM-DD-YYYY,	N/A	Required for all eCheck transactions for Wells Fargo SecureSource Merchants where the Tax ID or SSN is not provided.

## Gateway Response API

This section describes the response returned by the gateway when a transaction is submitted for processing. The gateway response to a transaction submitted via SIM is either a Receipt Page that is displayed to the consumer or a POST string to a site designated by the merchant. The merchant can then parse the POST string, customize a response, and submit it back to the gateway. The gateway will then relay the response to the customer's browser.

### Fields in the Gateway Response

The following table indicates the order of fields returned in the SIM response from the gateway to the merchant server for a Relay Response. Any fields that were sent to the gateway in addition to the fields described in the Standard Transaction Submission API are returned in the response after the set of fields described in the table below.

POSITION IN RESPONSE	FIELD NAME OF VALUE IN RESPONSE	DESCRIPTION
1	Response Code	Indicates the result of the transaction: 1 = Approved 2 = Declined 3 = Error
2	Response Subcode	A code used by the system for internal transaction tracking.
3	Response Reason Code	A code representing more details about the result of the transaction.
4	Response Reason Text	Brief description of the result, which corresponds with the Response Reason Code.
5	Approval Code	The six-digit alphanumeric authorization or approval code.
6	AVS Result Code	Indicates the result of Address Verification System (AVS) checks: A = Address (Street) matches, ZIP does not B = Address information not provided for AVS check E = AVS error G = Non-U.S. Card Issuing Bank N = No Match on Address (Street) or ZIP P = AVS not applicable for this transaction R = Retry – System unavailable or timed out S = Service not supported by issuer U = Address information is unavailable W = 9 digit ZIP matches, Address (Street) does not X = Address (Street) and 9 digit ZIP match Y = Address (Street) and 5 digit ZIP match Z = 5 digit ZIP matches, Address (Street) does not
7	Transaction ID	This number identifies the transaction in the system and can be used to submit a modification of this transaction at a later time, such as voiding, crediting or capturing the transaction.
8	Invoice Number	Echoed from form input value for x_Invoice_Num.
9	Description	Echoed from form input value for x_Description.
10	Amount	Echoed from form input value for x_Amount.
11	Method	Echoed from form input value for x_Method.
12	Transaction Type	Echoed from form input value for x_Type.
13	Customer ID	Echoed from form input value for x_Cust_ID.

POSITION IN RESPONSE	FIELD NAME OF VALUE IN RESPONSE	DESCRIPTION
14	Cardholder First Name	Echoed from form input value for x_First_Name.
15	Cardholder Last Name	Echoed from form input value for x_Last_Name.
16	Company	Echoed from form input value for x_Company.
17	Billing Address	Echoed from form input value for x_Address.
18	City	Echoed from form input value for x_City.
19	State	Echoed from form input value for x_State.
20	Zip	Echoed from form input value for x_Zip.
21	Country	Echoed from form input value for x_Country.
22	Phone	Echoed from form input value for x_Phone.
23	Fax	Echoed from form input value for x_Fax.
24	Email	Echoed from form input value for x_Email.
25	Ship to First Name	Echoed from form input value for x_Ship_To_First_Name.
26	Ship to Last Name	Echoed from form input value for x_Ship_To_Last_Name.
27	Ship to Company	Echoed from form input value for x_Ship_To_Company.
28	Ship to Address	Echoed from form input value for x_Ship_To_Address.
29	Ship to City	Echoed from form input value for x_Ship_To_City.
30	Ship to State	Echoed from form input value for x_Ship_To_State.
31	Ship to Zip	Echoed from form input value for x_Ship_To_Zip.
32	Ship to Country	Echoed from form input value for x_Ship_To_Country.
33	Tax Amount	Echoed from form input value for x_Tax.
34	Duty Amount	Echoed from form input value for x_Duty.
35	Freight Amount	Echoed from form input value for x_Freight.
36	Tax Exempt Flag	Echoed from form input value for x_Tax_Exempt.
37	PO Number	Echoed from form input value for x_PO_Num.
38	MD5 Hash	System-generated hash that may be validated by the merchant to authenticate a transaction response received from the gateway.
39	Card Code (CVV2/CVC2/CID) Response Code	Indicates the results of Card Code verification: M = Match N = No Match P = Not Processed S = Should have been present U = Issuer unable to process request
40 - 68		Reserved for future use.
69 -		Echo of merchant-defined fields.

## SIM Relay Response

The response from the gateway to a request via SIM for a Relay Response consists of a set of fields returned as a POST string to the merchant server at the location indicated in the *x\_Relay\_URL* field.

## ***SIM Transaction Response Versions***

There are two versions of the response string. The set of fields in the response differ based on the response version.

### **Version 3.0**

The version 3.0 response contains system fields from position 1 to 38 and echoes merchant defined fields from 39 on, in the order received by the system.

### **Version 3.1**

The version 3.1 response string contains 68 system fields with field number 39 representing the Card Code (CVV2/CVC2/CID) response code. Merchant-defined fields are echoed from field 69 on. Merchants wishing to use the Card Code feature must switch to response string version 3.1.

## **Setting the Response String Version**

To set the response string version, do the following:

1. Log into the Merchant Interface
2. Select *Settings* from the Main Menu
3. Click on *Response String Version* in the Transaction Response section
4. Change the response version using the drop-down box
5. Click *Submit*

## **Response Code Details**

When a payment transaction is submitted to the gateway, the gateway returns a response that indicates the general status of the transaction, including details of what caused the transaction to be in that state. The fields in the response that describe the status of the transaction are Response Code, Response Reason Code, and Response Reason Text. The following tables define the values that the gateway may return in these fields.

## **Description of Response Fields**

The three status fields in the transaction response are defined as follows:

- The *Response Code* indicates the overall status of the transaction with possible values of approval, decline, or error.
- The *Response Reason Code* gives merchants more information about the transaction status.
- The *Response Reason Text* is a text string that will give more detail on why the transaction resulted in a specific response code. This field is a text string that can be echoed back to the customer to provide them with more information about their transaction. It is strongly suggested that merchants not parse this string expecting certain text. Instead, a merchant should test for the Response Reason Code if they need to programmatically know these results; the Response Reason Code will always represent these meanings, even if the text descriptions change.

## Response Codes

RESPONSE CODE	DESCRIPTION
1	This transaction has been approved.
2	This transaction has been declined.
3	There has been an error processing this transaction.

## Response Reason Codes & Response Reason Text

RESPONSE CODE	RESPONSE REASON CODE	RESPONSE REASON TEXT	NOTES
1	1	This transaction has been approved.	
2	2	This transaction has been declined.	
2	3	This transaction has been declined.	
2	4	This transaction has been declined.	The code returned from the processor indicating that the card used needs to be picked up.
3	5	A valid amount is required.	The value submitted in the amount field did not pass validation for a number.
3	6	The credit card number is invalid.	
3	7	The credit card expiration date is invalid.	The format of the date submitted was incorrect.
3	8	The credit card has expired.	
3	9	The ABA code is invalid.	The value submitted in the x_Bank_ABA_Code field did not pass validation or was not for a valid financial institution.
3	10	The account number is invalid.	The value submitted in the x_Bank_Acct_Num field did not pass validation.
3	11	A duplicate transaction has been submitted.	A transaction with identical amount and credit card information was submitted two minutes prior.
3	12	An authorization code is required but not present.	A transaction that required x_Auth_Code to be present was submitted without a value.
3	13	The merchant Login ID is invalid or the account is inactive.	
3	14	The Referrer or Relay Response URL is invalid.	The Relay Response or Referrer URL does not match the merchant's configured value(s) or is absent. Applicable only to SIM and WebLink APIs.
3	15	The transaction ID is invalid.	The transaction ID value is non-numeric or was not present for a transaction that requires it (i.e., VOID, PRIOR_AUTH_CAPTURE, and CREDIT).
3	16	The transaction was not found.	The transaction ID sent in was properly formatted but the gateway had no record of the transaction.

3	17	The merchant does not accept this type of credit card.	The merchant was not configured to accept the credit card submitted in the transaction.
3	18	ACH transactions are not accepted by this merchant.	The merchant does not accept electronic checks.
3	19	An error occurred during processing. Please try again in 5 minutes.	
3	20	An error occurred during processing. Please try again in 5 minutes.	
3	21	An error occurred during processing. Please try again in 5 minutes.	
3	22	An error occurred during processing. Please try again in 5 minutes.	
3	23	An error occurred during processing. Please try again in 5 minutes.	
3	24	The Nova Bank Number or Terminal ID is incorrect. Call Merchant Service Provider.	
3	25	An error occurred during processing. Please try again in 5 minutes.	
3	26	An error occurred during processing. Please try again in 5 minutes.	
2	27	The transaction resulted in an AVS mismatch. The address provided does not match billing address of cardholder.	
3	28	The merchant does not accept this type of credit card.	The Merchant ID at the processor was not configured to accept this card type.
3	29	The PaymentTech identification numbers are incorrect. Call Merchant Service Provider.	
3	30	The configuration with the processor is invalid. Call Merchant Service Provider.	
3	31	The FDC Merchant ID or Terminal ID is incorrect. Call Merchant Service Provider.	The merchant was incorrectly set up at the processor.
3	32	This reason code is reserved or not applicable to this API.	
3	33	<i>FIELD</i> cannot be left blank.	The word <i>FIELD</i> will be replaced by an actual field name. This error indicates that a field the merchant specified as required was not filled in.
3	34	The VITAL identification numbers are incorrect. Call Merchant Service Provider.	The merchant was incorrectly set up at the processor.

3	35	An error occurred during processing. Call Merchant Service Provider.	The merchant was incorrectly set up at the processor.
3	36	The authorization was approved, but settlement failed.	
3	37	The credit card number is invalid.	
3	38	The Global Payment System identification numbers are incorrect. Call Merchant Service Provider.	The merchant was incorrectly set up at the processor.
3	39	The supplied currency code is either invalid, not supported, not allowed for this merchant or doesn't have an exchange rate.	
3	40	This transaction must be encrypted.	
3	41	This transaction has been declined.	Only merchants set up for the FraudScreen.Net service would receive this decline. This code will be returned if a given transaction's fraud score is higher than the threshold set by the merchant.
3	42	There is missing or invalid information in a required field.	This is applicable only to merchants processing through the Wells Fargo SecureSource product who have requirements for transaction submission that are different from merchants not processing through Wells Fargo.
3	43	The merchant was incorrectly set up at the processor. Call your merchant service provider.	The merchant was incorrectly set up at the processor.
3	44	This transaction has been declined.	The merchant would receive this error if the Card Code filter has been set in the Merchant Interface and the transaction received an error code from the processor that matched the rejection criteria set by the merchant.
3	45	This transaction has been declined.	This error would be returned if the transaction received a code from the processor that matched the rejection criteria set by the merchant for both the AVS and Card Code filters.
3	46	Your session has expired or does not exist. You must log in to continue working.	
3	47	The amount requested for settlement may not be greater than the original amount authorized.	This occurs if the merchant tries to capture funds greater than the amount of the original authorization-only transaction.
3	48	This processor does not accept partial reversals.	The merchant attempted to settle for less than the originally authorized amount.
3	49	A transaction amount greater than \$99,999 will not be accepted.	
3	50	This transaction is awaiting settlement and cannot be	Credits or refunds may only be performed against settled transactions. The transaction

		refunded.	against which the credit/refund was submitted has not been settled, so a credit cannot be issued.
3	51	The sum of all credits against this transaction is greater than the original transaction amount.	
3	52	The transaction was authorized, but the client could not be notified; the transaction will not be settled.	
3	53	The transaction type was invalid for ACH transactions.	If x_Method = ECHECK, x_Type cannot be set to CAPTURE_ONLY.
3	54	The referenced transaction does not meet the criteria for issuing a credit.	
3	55	The sum of credits against the referenced transaction would exceed the original debit amount.	The transaction is rejected if the sum of this credit and prior credits exceeds the original debit amount
3	56	This merchant accepts ACH transactions only; no credit card transactions are accepted.	The merchant processes eCheck transactions only and does not accept credit cards.
3	57	An error occurred in processing. Please try again in 5 minutes.	
3	58	An error occurred in processing. Please try again in 5 minutes.	
3	59	An error occurred in processing. Please try again in 5 minutes.	
3	60	An error occurred in processing. Please try again in 5 minutes.	
3	61	An error occurred in processing. Please try again in 5 minutes.	
3	62	An error occurred in processing. Please try again in 5 minutes.	
3	63	An error occurred in processing. Please try again in 5 minutes.	
3	64	The referenced transaction was not approved.	This error is applicable to Wells Fargo SecureSource merchants only. Credits or refunds cannot be issued against transactions that were not authorized.
3	65	This transaction has been declined.	The transaction was declined because the merchant configured their account through the Merchant Interface to reject transactions with certain values for a Card Code mismatch.
3	66	This transaction cannot be accepted for processing.	The transaction did not meet gateway security guidelines.
3	67	The given transaction type is not supported for this merchant.	This error code is applicable to merchants using the Wells Fargo SecureSource product only. This product does not allow transactions of type CAPTURE_ONLY.
3	68	The version parameter is invalid.	The value submitted in x_Version was invalid.
3	69	The transaction type is invalid.	The value submitted in x_Type was invalid.

3	70	The transaction method is invalid.	The value submitted in x_Method was invalid.
3	71	The bank account type is invalid.	The value submitted in x_Bank_Acct_Type was invalid.
3	72	The authorization code is invalid.	The value submitted in x_Auth_Code was more than six characters in length.
3	73	The driver's license date of birth is invalid.	The format of the value submitted in x_Drivers_License_Num was invalid.
3	74	The duty amount is invalid.	The value submitted in x_Duty failed format validation.
3	75	The freight amount is invalid.	The value submitted in x_Freight failed format validation.
3	76	The tax amount is invalid.	The value submitted in x_Tax failed format validation.
3	77	The SSN or tax ID is invalid.	The value submitted in x_Customer_Tax_ID failed validation.
3	78	The Card Code (CVV2/CVC2/CID) is invalid.	The value submitted in x_Card_Code failed format validation.
3	79	The driver's license number is invalid.	The value submitted in x_Drivers_License_Num failed format validation.
3	80	The driver's license state is invalid.	The value submitted in x_Drivers_License_State failed format validation.
3	81	The requested form type is invalid.	The merchant requested an integration method not compatible with the ADC Direct Response API.
3	82	Scripts are only supported in version 2.5.	The system no longer supports version 2.5; requests cannot be posted to scripts.
3	83	The requested script is either invalid or no longer supported.	The system no longer supports version 2.5; requests cannot be posted to scripts.
3	84	This reason code is reserved or not applicable to this API.	
3	85	This reason code is reserved or not applicable to this API.	
3	86	This reason code is reserved or not applicable to this API.	
3	87	This reason code is reserved or not applicable to this API.	
3	88	This reason code is reserved or not applicable to this API.	
3	89	This reason code is reserved or not applicable to this API.	
3	90	This reason code is reserved or not applicable to this API.	
3	91	Version 2.5 is no longer supported.	
3	92	The gateway no longer supports the requested method of integration.	
3	93	A valid country is required.	This code is applicable to Wells Fargo SecureSource merchants only. Country is a

			required field and must contain the value of a supported country.
3	94	The shipping state or country is invalid.	This code is applicable to Wells Fargo SecureSource merchants only.
3	95	A valid state is required.	This code is applicable to Wells Fargo SecureSource merchants only.
3	96	This country is not authorized for buyers.	This code is applicable to Wells Fargo SecureSource merchants only. Country is a required field and must contain the value of a supported country.
3	97	The time period for this request has expired.	Applicable only to SIM API. Fingerprints are only valid for a short period of time. This code indicates that the transaction fingerprint has expired.
3	98	This transaction cannot be accepted.	Applicable only to SIM API. The transaction fingerprint has already been used.
3	99	This transaction cannot be accepted.	Applicable only to SIM API. The server-generated fingerprint does not match the merchant-specified fingerprint in the x_FP_Hash field.
3	100	The eCheck type is invalid.	Applicable only to eCheck. The value specified in the x_Echeck_type field is invalid.
3	101	The given name on the account and/or the account type does not match the actual account.	Applicable only to eCheck. The specified name on the account and/or the account type do not match the NOC record for this account.
3	102	This request cannot be accepted.	A password or transaction key was submitted with this WebLink request. This is a high security risk.
3	103	This transaction cannot be accepted.	The fingerprint, transaction key, or password is required for this transaction.
3	104	This transaction is currently under review.	Applicable only to eCheck. The value submitted in x_Country failed validation.
3	105	This transaction is currently under review.	Applicable only to eCheck. The values submitted in x_City and x_Country failed validation.
3	106	This transaction is currently under review.	Applicable only to eCheck. The value submitted in x_Company failed validation.
3	107	This transaction is currently under review.	Applicable only to eCheck. The value submitted in x_Bank_Account_Name failed validation.
3	108	This transaction is currently under review.	Applicable only to eCheck. The values submitted in on x_First_Name and x_Last_Name failed validation.
3	109	This transaction is currently under review.	Applicable only to eCheck. The values submitted in x_First_Name and x_Last_Name failed validation.
3	110	This transaction is currently under review.	Applicable only to eCheck. The value submitted in x_Bank_Account_Name does not contain valid characters.

## SIM Best Practices

This section discusses some of the best practices recommended for the implementation of the Simple Integration Method. These should serve as guidelines to a robust and secure integration of the merchant's shopping site with the Payment Gateway

### Best Practices Summary

- The transaction key should be stored securely on the merchant's Web server or hosting provider.
- The transaction key should not be exposed in any Web page that is displayed the end customer.
- The transaction key should be changed periodically.
- The merchant server's system clock needs to be set to proper time and timezone.
- Merchant should collect payment data on secure pages only.
- The secret question and answer configured during merchant setup should be secured to prevent unauthorized personnel from obtaining the transaction key.
- The fingerprint should be generated as late as possible in the checkout process. It is recommended that the fingerprint be regenerated if the amount of the transaction is altered after the initial generation of the fingerprint.
- The order number or invoice number should be used as the sequence value to generate the fingerprint. It is recommended that the merchant perform a validation of the order before generating the fingerprint and submitting it to the gateway.

Some of the best practices summarized above are discussed in detail in the following paragraphs.

### ***Securely store the transaction key***

The most important aspect of implementing SIM in a secure fashion lies in storing the transaction key in a secure location where only authorized persons can see or modify it.

If the merchant is using a third-party shopping cart or hosting provider, it is recommended that the merchant determine the exact procedure by which the third party should securely store the transaction key. Only authorized third-party personnel should have access to the transaction key.

If the merchant uses a database like Oracle, MySQL, or SQL Server, another option is to store the transaction key in the database. In this case the merchant must ensure that the database login procedure is secure.

If the merchant is storing the transaction key in a file, strict access control and data encryption is strongly recommended. Access to the file should be restricted to only the script that generates the fingerprint.

The transaction key is highly confidential data, and should be protected accordingly.

### ***Do not expose the transaction key to the customer***

Under no circumstances should the transaction key be exposed in a Web page output that is displayed to the customer. Even if the transaction key appears in a hidden HTML form field or a hidden frame, the integration to the gateway is NOT then considered secure. A view HTML source on all the Web pages generated by the merchant to the customer should never display the transaction key.

The merchant should do everything possible to leverage the security features of their web server to secure the key from the end customer.

### ***Change transaction keys often***

It is recommended that the merchant establish a policy to change transaction keys frequently. The gateway provides a simple interface to quickly generate and obtain a new transaction key, as well as disabling the old transaction key. It is recommended that merchants disable the old transaction key each time a new transaction key is obtained.

It is recommended that the transaction key be changed if there is any suspicious activity on the merchant's account. Transaction activity can be monitored through the Merchant Interface.

A change in personnel with access to the transaction key, especially system administrators, should prompt a change in the transaction key.

### ***Secure the secret answer***

Configuring a secret question and answer is part of the merchant's account setup on the Payment Gateway. The secret answer is required to authenticate the merchant each time they change the transaction key. It is recommended that the merchant designate a specific individual or role that can change transaction keys. Only that individual or role should have knowledge of the secret question and answer and the ability to change the transaction key. A formal policy to change the transaction key and secret question and answer should be implemented in the event of personnel turnover. It is recommended that the merchant choose an answer that is not easily guessed.

### ***Generate fingerprint as late as possible in the checkout process***

It is a good practice to generate the fingerprint only at the last step of the checkout process, as opposed to generating it on every page or as each item is added to the shopping basket. The fingerprint should be generated by the merchant's server-side script when the final transaction amount is known and the customer has committed to the purchase.

If the transaction amount changes between the generation of the fingerprint and the submission of the transaction and the fingerprint is not updated, the transaction will be rejected. This is because the transaction amount submitted in the post string will not match the amount encrypted in the fingerprint.

If the merchant's checkout process is such that the fingerprint is generated each time an item is added to a shopping cart, or multiple times before an order is complete and ready to be submitted to the gateway, merchants may become subject to abuse by the end user. It is possible that an unauthorized person could view source on each page the fingerprint is generated, accumulate the

unused fingerprints, and use them to submit unauthorized transactions to the gateway until the fingerprints expire.

**Validate orders when generating fingerprint**

It is also recommended that the merchant use their unique order number or invoice number as the sequence value, submitted in the *x\_FP\_Sequence* field. The merchant can then validate the transaction against the merchant-generated invoice or order number before using the sequence value to generate the fingerprint.

**Ensure your system clock is set to proper time and timezone**

The gateway will validate the timestamp of a fingerprint submitted to the system before accepting a transaction. This check is based on the value sent in *x\_FP\_Timestamp* field. The gateway will only accept a fingerprint generated within an hour before the transaction was received. If the fingerprint has expired, the transaction will be rejected.

The acceptance of the transaction by the gateway is therefore dependant on the merchant's system clock being set to the correct time based on the timezone setting of the system. Though it is not required that the system clock be accurate to the last second, it is recommended that the clock is as close as possible to the actual time for the merchant's timezone.

## Appendix A – Types of Credit Card Transactions

There are two steps to credit card transaction processing:

1. *Authorization* is the process of checking the validity and available balance of a customer's credit card before the transaction is accepted. The transaction submission methods describe the request for authorization.
2. *Settlement*, also referred to as “Capture,” is the process by which the funds are actually transferred from the customer to the merchant for goods and services sold. Based on the transaction type specified in the authorization request, the gateway will initiate the settlement step. As part of the settlement process, the gateway will send a settlement request to the financial institution to request transfer of funds. Please note that the timeframe within which funds are actually transferred is not controlled by the gateway.

Note: The merchant can specify when the last transaction is picked up for settlement by the gateway. To modify the Transaction Cut-Off Time, do the following:

1. Log into the Merchant Interface
2. Select *Settings*
3. Select *Transaction Cut-Off Time* in the General section
4. Using the drop-down boxes, select the desired cut-off time
5. Click *Submit* to save changes

### Credit Card Transaction Types

The following table describes the type of transactions that can be submitted to the gateway and how the gateway will process them.

TRANSACTION TYPE	DESCRIPTION
AUTH_CAPTURE	Transactions of this type will be sent for authorization. The transaction will be automatically picked up for settlement if approved. This is the default transaction type in the gateway. If no type is indicated when submitting transactions to the gateway, the gateway will assume that the transaction is of the type AUTH_CAPTURE.
AUTH_ONLY	Transactions of this type are submitted if the merchant wishes to validate the credit card for the amount of the goods sold. If the merchant does not have goods in stock or wishes to review orders before shipping the goods, this transaction type should be submitted. The gateway will send this type of transaction to the financial institution for approval. However this transaction will not be sent for settlement. If the merchant does not act on the transaction within 30 days, the transaction will no longer be available for capture.
PRIOR_AUTH_CAPTURE	This transaction is used to request settlement for a transaction that was previously submitted as an AUTH_ONLY. The gateway will accept this transaction and initiate settlement if the following conditions are met: <ul style="list-style-type: none"><li>• The transaction is submitted with the ID of the original authorization-only transaction, which needs to be settled.</li><li>• The transaction ID is valid and the system has a record of the original authorization-only transaction being submitted.</li><li>• The original transaction referred to is not already settled or expired or errored.</li></ul>

	<ul style="list-style-type: none"> <li>The amount being requested for settlement in this transaction is less than or equal to the original authorized amount.</li> </ul> <p>If no amount is submitted in this transaction, the gateway will initiate settlement for the amount of the originally authorized transaction.</p> <p>In addition to the required fields in the API, the following is required to submit a PRIOR_AUTH_CAPTURE type transaction:</p> <ul style="list-style-type: none"> <li>x_Version = 3.1</li> <li>x_Login = merchant Login ID</li> <li>x_FP_Hash = the transaction fingerprint</li> <li>x_FP_Sequence = merchant-determined sequence value</li> <li>x_FP_Timestamp = timestamp for the generation of the fingerprint</li> <li>x_Trans_ID = the transaction ID of the previously authorized transaction</li> </ul>
CREDIT	<p>This transaction is also referred to as a “Refund” and indicates to the gateway that money should flow from the merchant to the customer. The gateway will accept a credit or a refund request if the transaction submitted meets the following conditions:</p> <ul style="list-style-type: none"> <li>The transaction is submitted with the ID of the original transaction against which the credit is being issued (x_Trans_ID).</li> <li>The gateway has a record of the original transaction.</li> <li>The original transaction has been settled.</li> <li>The sum of the amount submitted in the Credit transaction and all credits submitted against the original transaction is less than the original transaction amount.</li> <li>The first and last four digits of the credit card number submitted with the credit transaction match the first and last four digits of the credit card number used in the original transaction.</li> </ul> <p>If no credit card number is submitted with the transaction and all the checks pass, the Credit will be issued against the credit card used in the original transaction.</p> <p>A fingerprint is required to submit a credit to the system (i.e., x_FP_Hash should have a valid value when a CREDIT transaction is submitted).</p>
CAPTURE_ONLY	<p>This is a request to settle a transaction that was not submitted for authorization through the payment gateway. The gateway will accept this transaction if an authorization code is submitted. x_Auth_Code is a required field for CAPTURE_ONLY type transactions.</p>
VOID	<p>This transaction is an action on a previous transaction and is used to cancel the previous transaction and ensure it does not get sent for settlement. It can be done on any type of transaction (i.e., CREDIT, AUTH_CAPTURE, CAPTURE_ONLY, and AUTH_ONLY). The transaction will be accepted by the gateway if the following conditions are met:</p> <ul style="list-style-type: none"> <li>The transaction is submitted with the ID of the transaction that has to be voided.</li> <li>The gateway has a record of the transaction referenced by the ID.</li> <li>The transaction has not been sent for settlement.</li> </ul> <p>For a transaction of type VOID, the following fields are required (in addition to the other required fields in the API):</p> <ul style="list-style-type: none"> <li>x_Version = 3.1</li> <li>x_Login = merchant Login ID</li> </ul>

	<ul style="list-style-type: none"><li>• x_FP_Hash = the transaction fingerprint</li><li>• x_FP_Sequence = merchant-determined sequence value</li><li>• x_FP_Timestamp = timestamp for the generation of the fingerprint</li><li>• x_Trans_ID = the transaction ID that needs to be voided</li></ul>
--	---

## Appendix B – Features of the Gateway

The following features are supported by the gateway in an effort to reduce merchant's chargeback liability.

### Address Verification System

The Address Verification System (AVS) helps merchants to detect suspicious transaction activity. To use this system, the merchant must submit the customer's credit card billing address to the gateway for validation. This information is submitted by the gateway to the financial institutions. The financial institutions compare the submitted address with the billing address on file for that particular credit card and return an AVS response code to the gateway. The gateway includes this code in the response back to the merchant.

The merchant can configure the gateway to reject or accept transactions based on the AVS code returned. To configure rejection or acceptance of a transaction based on the AVS code, do the following:

1. Log into the Merchant Interface
2. Select *Settings* from the Main Menu
3. Click on the *Address Verification System (AVS)* link from the Security section
4. Check the box(es) next to the AVS codes that the system should reject
5. Click *Submit* to save changes

AVS CODE	DESCRIPTION ( <i>Italics denote a default setting</i> )
A	Address (Street) matches, ZIP does not
B	<i>Address information not provided for AVS check</i>
E	<i>AVS error</i>
G	<i>Non U.S. Card Issuing Bank</i>
N	<i>No Match on Address (Street) or ZIP</i>
P	AVS not applicable for this transaction
R	<i>Retry – System unavailable or timed out</i>
S	<i>Service not supported by issuer</i>
U	<i>Address information is unavailable</i>
W	9 digit ZIP matches, Address (Street) does not
X	Address (Street) and 9 digit ZIP match
Y	Address (Street) and 5 digit ZIP match
Z	5 digit ZIP matches, Address (Street) does not

**Note:** It is recommended that merchants enable some level of Address Verification to avoid non-qualified transaction surcharges that can be levied by merchant banks and merchant service providers. Please note, however, that the merchant will incur applicable transaction fees for transactions that are declined due to an AVS mismatch (as with any other declined transaction). System defaults are marked in italics in the table above.

## Credit Card Identification Code (CVV2/CVC2/CID)

The Credit Card Identification Code, or “Card Code,” is a three- or four-digit security code that is printed on the back of credit cards in reverse italics in the card’s signature panel (or on the front for American Express cards). The merchant can collect this information from the customer and submit the data to the gateway. The gateway will pass this information to the financial institution along with the credit card number. The financial institution will determine if the value matches the value on file for that credit card and return a code indicating whether the comparison failed or succeeded, in addition to whether the card was authorized. The gateway passes back this response code to the merchant. The merchant can configure the gateway to reject or accept the transaction based on the code returned.

To configure the filter to reject certain Card Code responses, do the following:

1. Log in-to the Merchant Interface
2. Select *Settings* from the Main Menu
3. Click on the *Card Code Verification* link from the Security section
4. Check the box(es) next to the Card Codes that the system should reject
5. Click *Submit* to save changes

CARD CODE RESPONSE	DESCRIPTION
M	Card Code matches
N	Card Code does not match
P	Card Code was not processed
S	Card Code should be on card but was not indicated
U	Issuer was not certified for Card Code

## Appendix C – Customizing Notification to Customers

Merchants will be sent a confirmation email after the gateway completes processing on a transaction submitted to the system. The confirmation email enables merchants to know the results of a given transaction. Multiple contacts can be configured to receive these email notifications. Additionally, merchants can choose to send a confirmation email to their customers.

Configuration of these contacts can be done through the Merchant Interface:

1. Log into the Merchant Interface
2. Click on the *Settings* link from the left navigation bar
3. Click on the *Email Receipts* link from the Transaction Response section
4. Check the box if email receipts should be sent to the customer
5. Configure the header and footer of the email message
6. Click *Submit*

It is possible to configure the confirmation email on a per-transaction basis by submitting the information with each transaction. The following table describes the fields used in the API to configure email notification to the customer; all fields are optional.

FIELD	VALUE	DESCRIPTION
x_Email_Customer	TRUE, FALSE	<p>If set to TRUE, the gateway will send an email to the customer after the transaction is processed using the customer email supplied in the transaction. If FALSE, no email will be sent to the customer.</p> <p>If no value is submitted, the gateway will look up the configuration in the Merchant Interface and send an email only if the merchant has configured the option to be TRUE.</p> <p>If there are no incoming parameters and the merchant has not configured this option, no email will be sent to the customer.</p>
x_Header_Email_Receipt	Any valid text	This text will appear as the header on the transaction confirmation email sent to the customer.
x_Footer_Email_Receipt	Any valid text	This text will appear as the footer on the transaction confirmation email sent to the customer.

## Appendix D – Submitting Test Transactions to the System

### Test Mode

Test Mode is a special mode of interacting with the system that is useful during the initial setup phase, where a merchant may want to test their setup without processing live card data.

To set an account to Test Mode, do the following:

1. Log into the Merchant Interface
2. Select *Settings* from the Main Menu
3. Click on the *Test Mode* Link in the General section
4. Click on the *Turn Test On* button

In Test Mode, all transactions appear to be processed as real transactions. The gateway accepts the transactions, but does not pass them on to the financial institutions. Accordingly, all transactions will be approved by the gateway when Test Mode is turned on. Transactions submitted in Test Mode are not stored on the system, and will not appear in any reports or lists.

Note: Test Mode is only supported if the merchant is submitting transactions from a Website or through the Virtual Terminal. If the merchant uploads a file of transactions for offline processing, the gateway will reject the file.

### Running a Test Transaction

It is possible to run a test transaction if Test Mode has been turned off. This can be done by indicating to the gateway in the transaction submission request that the transaction should be processed as a test transaction. The corresponding field in the transaction submission API is `x_Test_Request`. If a test transaction is desired, the value of this field should be set to TRUE.

The following table describes the gateway behavior based on the incoming field value and the mode configured through the Merchant Interface.

VALUE PASSED IN X_TEST_REQUEST	CONFIGURATION IN MERCHANT INTERFACE	GATEWAY BEHAVIOR
TRUE	ON	Transaction processed as test
FALSE	ON	Transaction processed as test
TRUE	OFF	Transaction processed as test
FALSE	OFF	Transaction processed as a live transaction

If there is no value submitted in the `x_Test_Request` field, the system will use the configuration specified in the Merchant Interface.

### ***Test credit card numbers***

Any of the following card numbers can be used to run test transactions. Please note that these numbers do not represent real card accounts; they will return a decline in live mode, and an approval in test mode. Any expiration dates after the current day's date can be used with these numbers.

TEST CARD NUMBER	CARD TYPE
370000000000002	American Express
601100000000012	Discover
542400000000015	MasterCard
4007000000027	Visa

There is also a test credit card number that can be used to generate errors. **THIS CARD IS INTENDED TO PRODUCE ERRORS**, and should only be used if that is the intent.

To cause the system to generate a specific error, set the account to Test Mode and submit a transaction with the card number 422222222222. The system will return the response reason code equal to the amount of the submitted transaction. For example, to test response reason code number 27, a test transaction would be submitted with the credit card number, "422222222222," and the amount, "27.00."

## Appendix E – Sample Scripts

The sample scripts provided through the Merchant Interface will generate a Payment Form request containing a fingerprint. The gateway will return a Payment Form. These sample scripts are provided to facilitate the merchant's understanding of the SIM integration and should not be implemented without proper modification. They can be modified to fit the context of the merchant's checkout process.

To download a sample script:

1. Log into the Merchant Interface
2. Select *Help* from the Main Menu
3. Click on *Sample Simple Integrations (SIM) Scripts*.

### ASP Script

There are 4 files provided in this sample.

FILE	DESCRIPTION
SIM.asp	Executing this script results in the display of the gateway's Payment Form
MD5.asp	This file contains a free implementation of the MD5 algorithm, and has been modified with runat=server script tags to allow it to be run as a server-side script.
SIMData.asp	This file contains text for merchant Login ID and transaction key. This is where the merchant's Login ID and transaction key need to be stored securely. This file has to be securely stored on a Web server. It is recommended that the merchant use a more secure method in their production environment to store the Login ID and transaction key based on facilities provided by their hosting provider and the shopping cart.
SIMlib.asp	Contains HMAC implementations and some lib functions for the SIM protocol

To run this integration, install the scripts on the Web server. Replace the value in SIMDdata.asp with the merchant Login ID and transaction key. Execute the SIM.asp script.

Http://<machine>/<virtualdir>/ASP/sim.asp?x\_Amount=100.25&x\_Description=Coolstuff should show the gateway's Payment Form with an amount of \$100.25 prefilled. The request to get the Payment Form would have contained the fingerprint.

This will generate the gateway's Payment Form and uses a set of functions to generate a random sequence number and calculate the time in seconds from 1970. The amount here is hardcoded to \$1.

Some of the functions that are used in this integration are:

FUNCTION	DESCRIPTION
<i>Function InsertFP (login, txnkey,</i>	Inserts the fingerprint into the post string and submits a transaction to the gateway. As part of the integration, the merchant's Website must

<i>amount, sequence)</i>	pass the parameters to this function. The parameters are the merchant's Login ID, the merchant transaction key, the transaction amount, and a sequence number to identify this transaction. This can be a randomly-generated number or map to an order number or invoice number.
<i>Function GetSecondssince1970 ( )</i>	Calculates the number of seconds since 1970 and is required for the x_Timestamp field of the SIM API.
<i>FuntionCalculateFP ((Loginid, txnkey, amount, sequence, tstamp)</i>	This function calculates the fingerprint. As part of the integration, the merchant's Website must pass the parameters to this function. The parameters are the merchant's Login ID, the merchant transaction key, the transaction amount, a sequence number to identify this transaction, and the timestamp. The sequence number can be a randomly-generated number or map to an order number or invoice number. The timestamp is the number of seconds elapsed since January 1 <sup>st</sup> 1970 (UTC). This can be obtained by first calling the function GetSecondsSince1970.

Merchants that wish to control where the fingerprint is generated should use the *Function CalculateFP* provided by the gateway and pass in the required parameters including the sequence number and amount. The timestamp can be calculated using the *Function GetSecondssince1970()*.

The script uses the *Function InsertFP()* to calculate the fingerprint and includes it in the post string to generate the gateway's Payment Form.

## PHP Script

There are 3 files provided in this sample.

FILE	DESCRIPTION
SIM.php	Executing this script results in the display of the gateway's Payment Form
SIMData.php	This file contains text for merchant Login ID and transaction key. This is where the merchant's Login ID and transaction key need to be stored securely. This file has to be securely stored on a Web server. We recommend that the merchant use a more secure method in their production environment to store the Login ID and transaction key based on facilities provided by their hosting provider and the shopping cart.
SIMlib.php	Contains HMAC implementations and some lib functions for the SIM protocol

These files should be installed on the Web server. The text in the data.php file should be replaced with the merchant Login ID and transaction key.

Http://<machine>/<virtualdir>/PHP/sim.php?x\_Amount=100.25x\_Description=Coolstuff should show the gateway Payment Form with an amount of \$100.25 prefilled. The request to get the Payment Form would have contained the fingerprint. The functions used to generate the fingerprint are the same as described in the ASP Script sections.

## Perl Script

There are 3 files provided in this sample.

FILE	DESCRIPTION
SIM.pl	Executing this script results in the display of the gateway's Payment Form
MyHMAC.pm:	Contains HMAC implementation and some lib functions for SIM protocol
SIMlib.pm	Contains HMAC implementations and some lib functions for the SIM protocol

Executing SIM.pl will send a request to the gateway (with a fingerprint) for a Payment Form. The functions used to generate the fingerprint are the same as described in the ASP Script section.

## Appendix F – Certification

It is possible for a merchant to test their integration using a test gateway system.

In order to test the integration, the merchant should post transactions to

**<https://certification.authorize.net/gateway/transact.dll>**. The test gateway behavior will be identical to the primary gateway. Transactions sent to the test gateway are not submitted to financial institutions for authorization, will not be stored on the system and cannot be retrieved from the system (as is the case when using Test Mode set to TRUE with the primary gateway system).

## Appendix G – Currency Codes

CURRENCY COUNTRY	CURRENCY CODE
Afghani (Afghanistan)	AFA
Algerian Dinar (Algeria)	DZD
Andorran Peseta (Andorra)	ADP
Argentine Peso (Argentina)	ARS
Armenian Dram (Armenia)	AMD
Aruban Guilder (Aruba)	AWG
Australian Dollar (Australia)	AUD
Azerbaijani Manat (Azerbaijan)	AZM
Bahamian Dollar (Bahamas)	BSD
Bahraini Dinar (Bahrain)	BHD
Baht (Thailand)	THB
Balboa (Panama)	PAB
Barbados Dollar (Barbados)	BBD
Belarussian Ruble (Belarus)	BYB
Belgian Franc (Belgium)	BEF
Belize Dollar (Belize)	BZD
Bermudian Dollar (Bermuda)	BMD
Bolivar (Venezuela)	VEB
Boliviano (Bolivia)	BOB
Brazilian Real (Brazil)	BRL
Brunei Dollar (Brunei Darussalam)	BND
Bulgarian Lev (Bulgaria)	BGN
Burundi Franc (Burundi)	BIF
Canadian Dollar (Canada)	CAD
Cape Verde Escudo (Cape Verde)	CVE
Cayman Islands Dollar (Cayman Islands)	KYD
Cedi (Ghana)	GHC
CFA Franc BCEAO (Guinea-Bissau)	XOF
CFA Franc BEAC (Central African Republic)	XAF
CFP Franc (New Caledonia)	XPF
Chilean Peso (Chile)	CLP
Colombian Peso (Colombia)	COP
Comoro Franc (Comoros)	KMF
Convertible Marks (Bosnia And Herzegovina)	BAM
Cordoba Oro (Nicaragua)	NIO
Costa Rican Colon (Costa Rica)	CRC
Cuban Peso (Cuba)	CUP
Cyprus Pound (Cyprus)	CYP
Czech Koruna (Czech Republic)	CZK
Dalasi (Gambia)	GMD
Danish Krone (Denmark)	DKK
Denar (The Former Yugoslav Republic Of Macedonia)	MKD
Deutsche Mark (Germany)	DEM
Dirham (United Arab Emirates)	AED
Djibouti Franc (Djibouti)	DJF
Dobra (Sao Tome And Principe)	STD
Dominican Peso (Dominican Republic)	DOP

Dong (Vietnam)	VND
Drachma (Greece)	GRD
East Caribbean Dollar (Grenada)	XCD
Egyptian Pound (Egypt)	EGP
El Salvador Colon (El Salvador)	SVC
Ethiopian Birr (Ethiopia)	ETB
Euro (Europe)	EUR
Falkland Islands Pound (Falkland Islands)	FKP
Fiji Dollar (Fiji)	FJD
